

Bayside Conceptual Adaptation Strategy Designs Captiva, FL

Captiva Community Panel Meeting
January 11, 2022

Bio – Dr. Cheryl Hapke

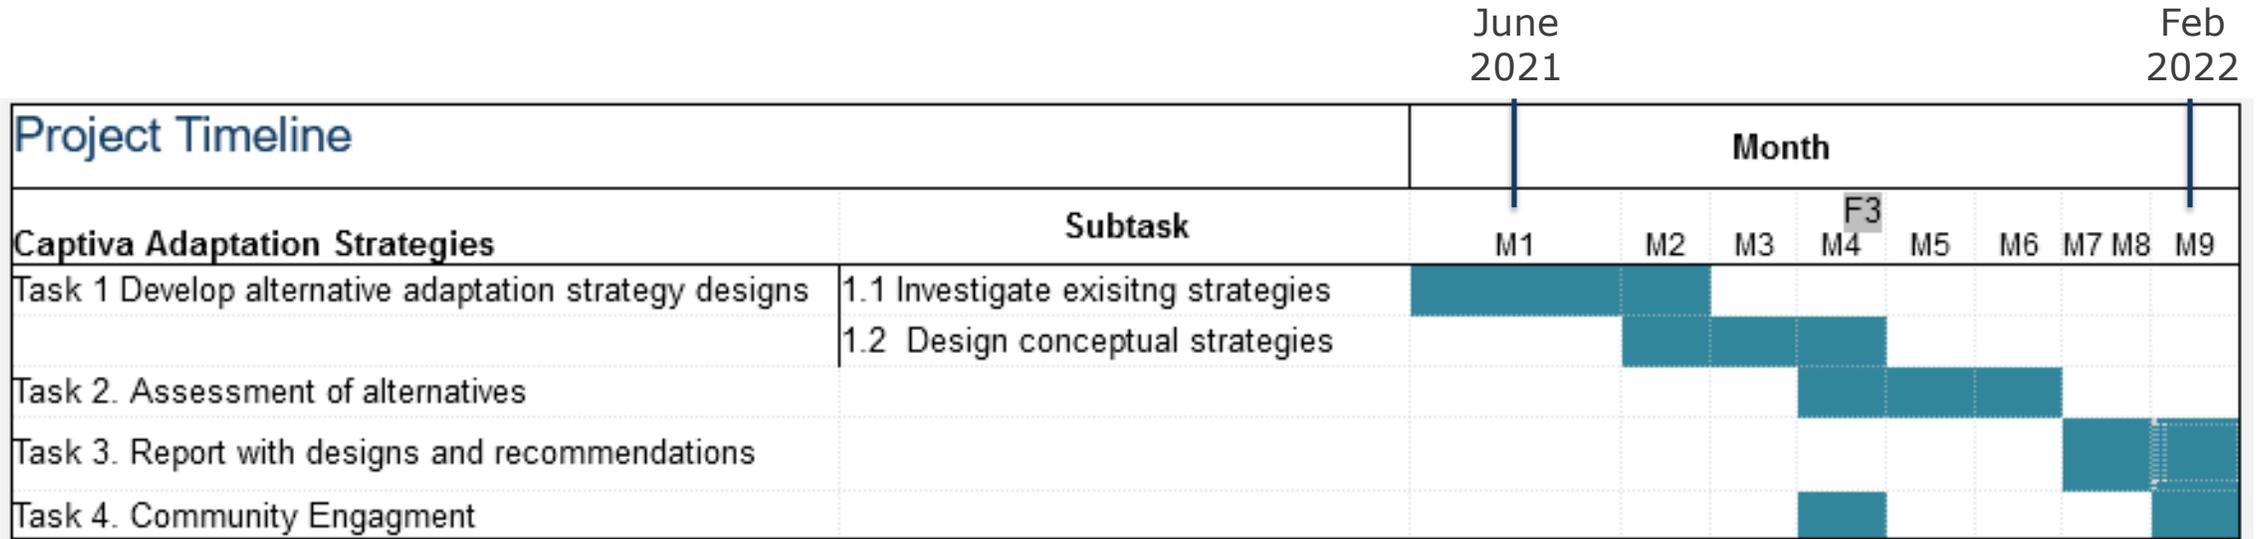

- Ph.D. in Coastal Geology, UC Santa Cruz
- 22 years with U.S. Geological Survey studying coastal change hazards and vulnerabilities (early retirement in 2019)
- Integral Consulting: Coastal Resilience lead, East and Gulf Coasts
 - Working with communities and coastal facilities to understand and model coastal hazards, conduct vulnerability and risk assessments, and develop adaptation plans to address storm and sea level rise hazards
- Research Professor at USF College of Marine Science
- 2021 AEG Jahn’s Distinguished Lecturer, also awarded a 2021 Presidential Citation from AEG
- Over 80 peer-reviewed papers, book chapters and technical reports
- Served as coastal science subject matter expert to numerous local, state and federal agencies

Background and Scope

- Project initiated following Integral's completion of a baseline sea level rise (SLR) vulnerability assessment (1, 2, and 4 ft of SLR)
- Vulnerability assessment *only included SLR*, not storms: have submitted 3 grant proposals to conduct full assessments of both Captiva and Sanibel that include storm modelling as well as SLR
- Captiva SLR committee identified 5 priority areas on bayside of island
- Committee funded Integral to develop conceptual adaptation designs for 2 ft of SLR for each of 5 bayside priority areas
- Integral presented designs to SLR committee (iterative process); currently working on a technical memorandum that will be available to the community

Timeline

Vulnerability Assessment 2 ft SLR

Site characteristics

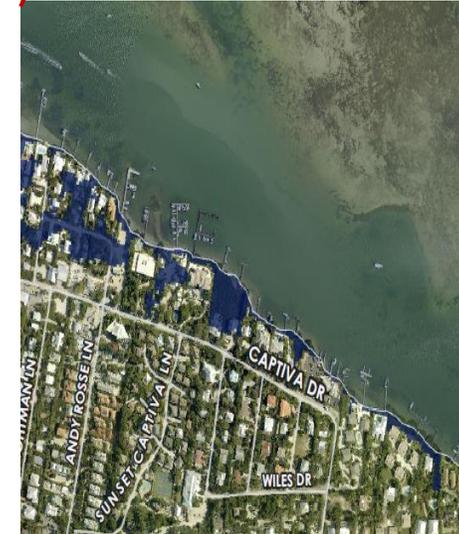

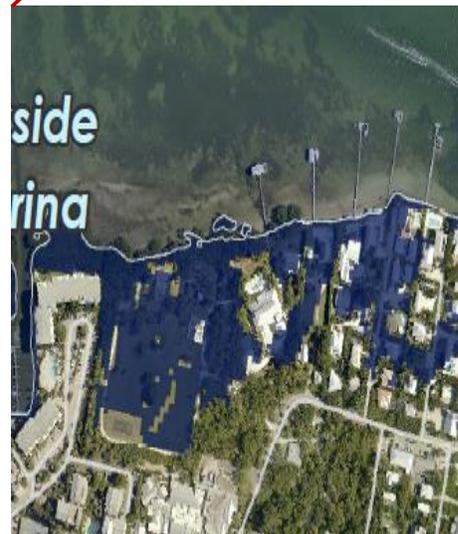

- Low wave exposure
- Large accommodation space
- Low gradient
- Low tidal flow
- Protective seagrass beds/shoals

Site characteristics

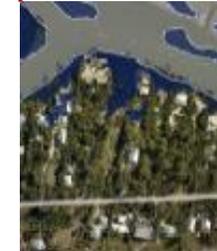

- High potential exposure to waves
- Moderate accommodation space
- Some tidal flow impacts
 - (3>2)
- Depth variations
- Different orientations

Site characteristics

- No exposure to waves
- Tidal flow impacts
- Little accommodation space

Site characteristics

- Moderate exposure to waves
- Large tidal flow impacts
- Little accommodation space

Gray vs. Green Adaptation Solutions

HOW GREEN OR GRAY SHOULD YOUR SHORELINE SOLUTION BE?

GREEN - SOFTER TECHNIQUES

GRAY - HARDER TECHNIQUES

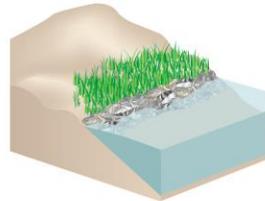

Living Shorelines

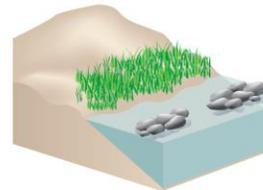

VEGETATION ONLY -
Provides a buffer to upland areas and breaks small waves. Suitable for low wave energy environments.

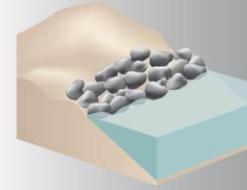

EDGING -
Added structure holds the toe of existing or vegetated slope in place. Suitable for most areas except high wave energy environments.

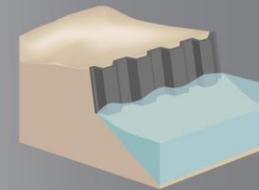

SILLS -
Parallel to vegetated shoreline, reduces wave energy, and prevents erosion. Suitable for most areas except high wave energy environments.

BREAKWATER -
(vegetation optional) - Offshore structures intended to break waves, reducing the force of wave action, and encourage sediment accretion. Suitable for most areas.

REVETMENT -
Lays over the slope of the shoreline and protects it from erosion and waves. Suitable for sites with existing hardened shoreline structures.

BULKHEAD -
Vertical wall parallel to the shoreline intended to hold soil in place. Suitable for high energy settings and sites with existing hard shoreline structures.

Conceptual Designs

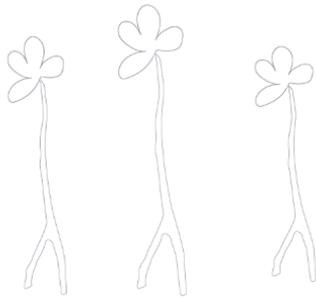

- Considered green and gray options (living shorelines through seawalls)
- Evaluated designs/design elements based on:
 - Efficacy
 - Economics
 - Sustainability
 - Impacts on nature
 - Consistency with Captiva Plan
 - Permissible in an aquatic preserve
- Elements are interconnected, designed to be used together and complement one another
- All adaptation strategies will require maintenance through time

Design Elements

Mangrove seedling = individual mangrove seedlings

Purpose: inexpensive approach to encourage mangrove recovery and propagation

Where: locations with low exposure to waves and tidal flow or that are protected from waves and flow by other features (i.e. sediment berms)

Young mangrove = small but established mangrove trees

Purpose: restores mangroves and encourages propagation

Where: locations where mangroves have been removed or heavily cropped/thinned; locations where tidal flow is too high for mangrove seedlings; to enhance and encourage seedlings to propagate

Design Elements

Salt tolerant vegetation = landscaping option

Purpose: provides root system to hold elevated fill in place; provides aesthetics landward of seawalls

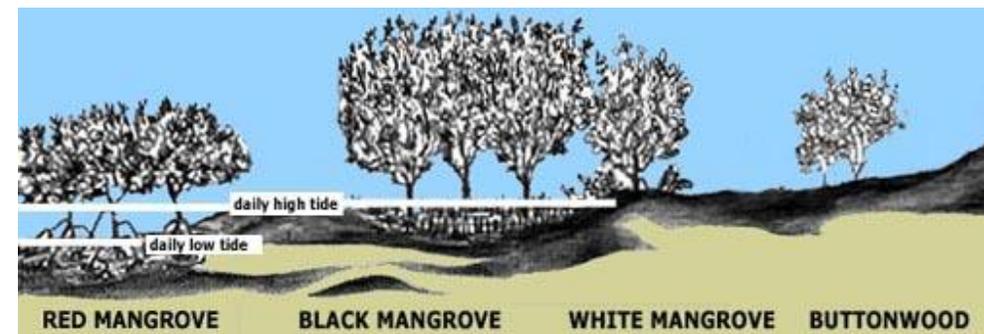

Where: landward locations to where no plantings exist or where land surface has been elevated with fill

Upland (black) mangroves = mangrove varieties that exist higher in the intertidal zone

Purpose: restores natural landward mangrove fringe; creates more diverse mangrove forest

Where: landward locations where mangroves have been removed or heavily cropped/thinned

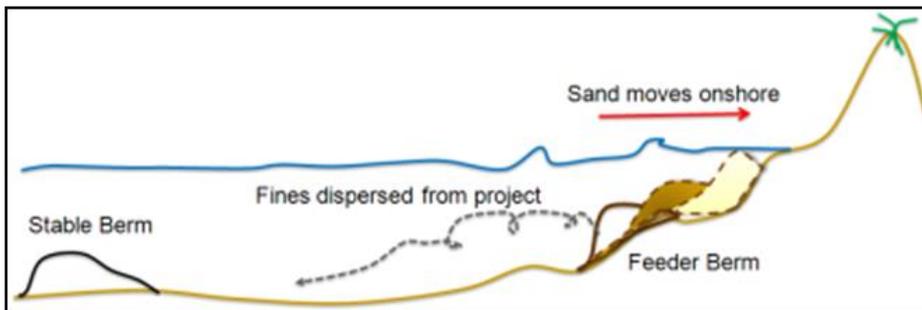

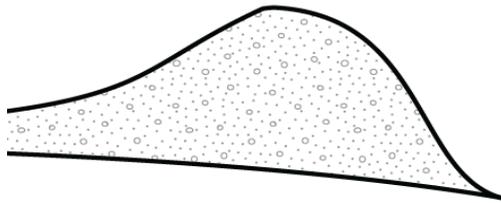

Design Elements

Protective berm or feeder berm = sand or silt dependent on its purpose

Purpose: provide protection of living shoreline components (i.e. mangrove seedlings), and acts as feeder berm to provide additional sediment to encourage mangrove propagation landward of the berm

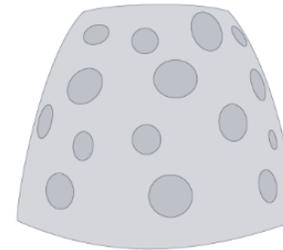

Where: applicable in all types of environments except for where there is strong tidal flow (i.e. Blind Pass)

Reef balls = portable fiberglass mold, filled with concrete

Purpose: protection from erosion; supports marine life, recruitment

Where: areas of high tidal flow and medium wave exposure

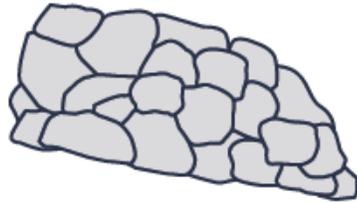

Design Elements

Rock sill = cobbles

Purpose: provide protection for sediment berm from wave and current erosion

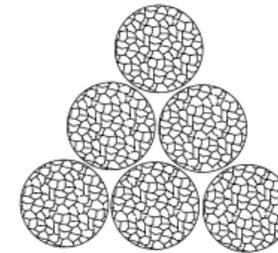

Where: locations where exposure to waves and tidal flow is medium to high

Coir logs (natural material)

Purpose: provide core reinforcement to protective sediment berm or feeder berm

Where: locations where exposure to waves and tidal flow is medium to high

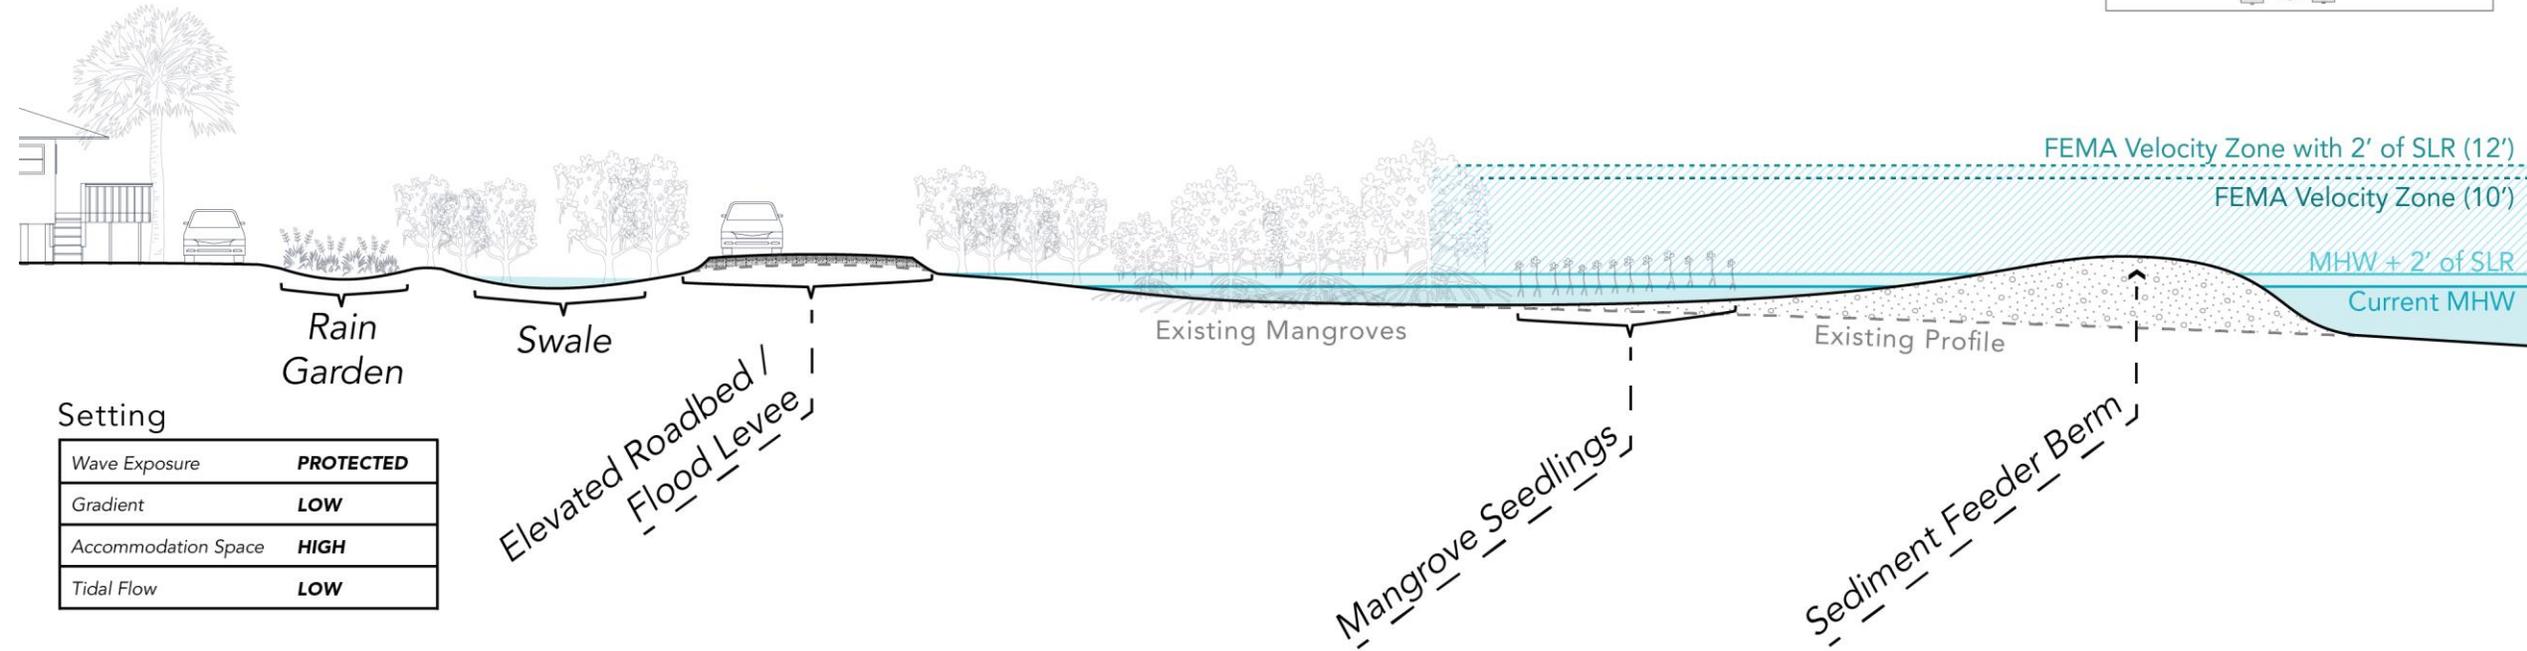

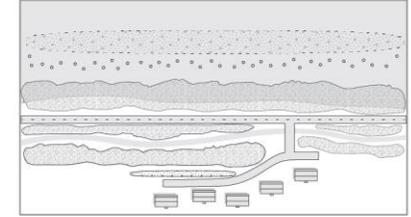

Conceptual Designs - Section A

Section A

Captiva Isl.

Overhead

Priority Area 1: Chadwick Bayou

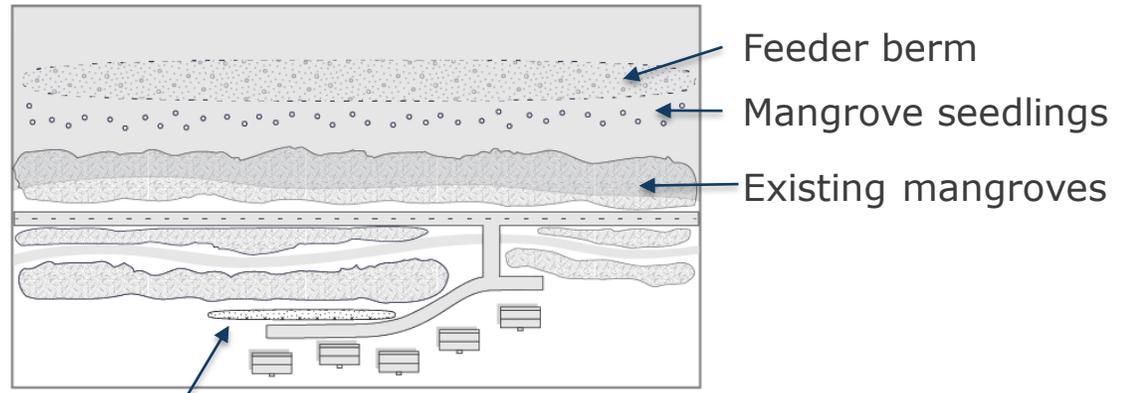

Conceptual Designs - Section A

Priority Area 1: Chadwick Bayou

Setting

Wave Exposure	PROTECTED
Gradient	LOW
Accommodation Space	HIGH
Tidal Flow	LOW

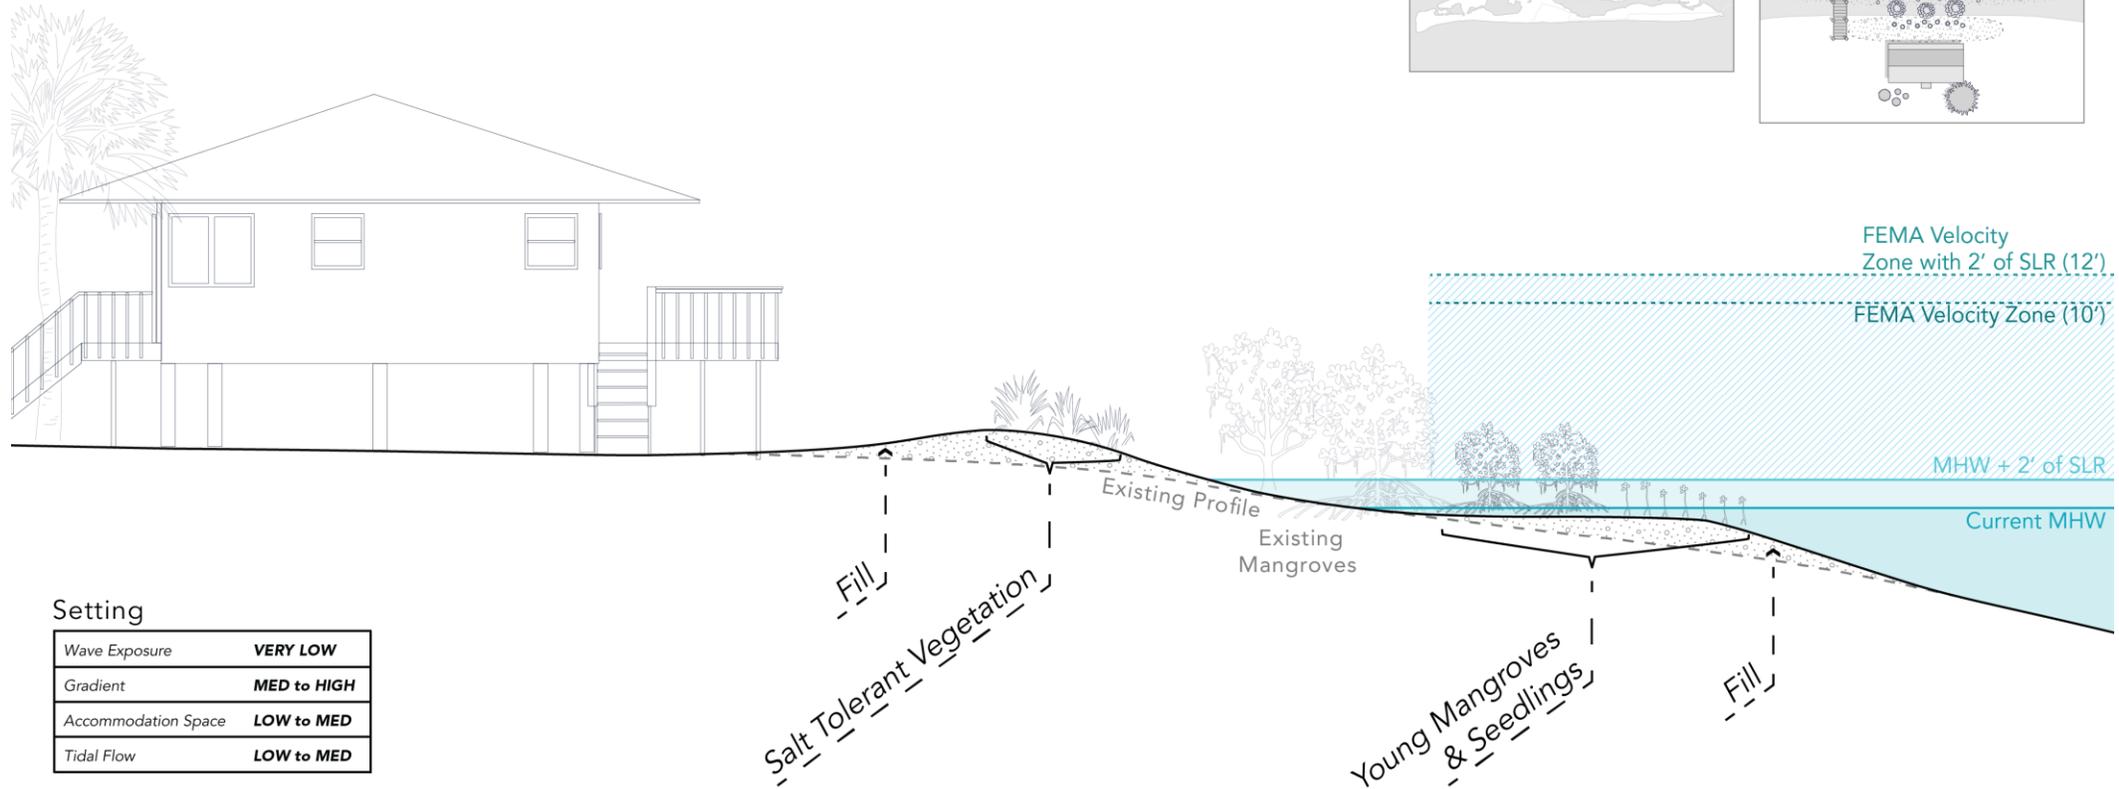

Overhead

Rain garden

Conceptual Designs - Section B

Section B

Setting

Wave Exposure	VERY LOW
Gradient	MED to HIGH
Accommodation Space	LOW to MED
Tidal Flow	LOW to MED

Priority Area 4: Buck Key

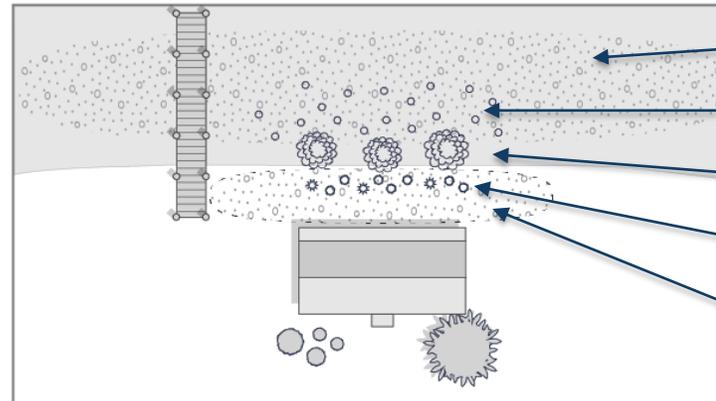

Conceptual Designs - Section B

Priority Area 4: Buck Key

Setting

Wave Exposure	VERY LOW
Gradient	MED to HIGH
Accommodation Space	LOW to MED
Tidal Flow	LOW to MED

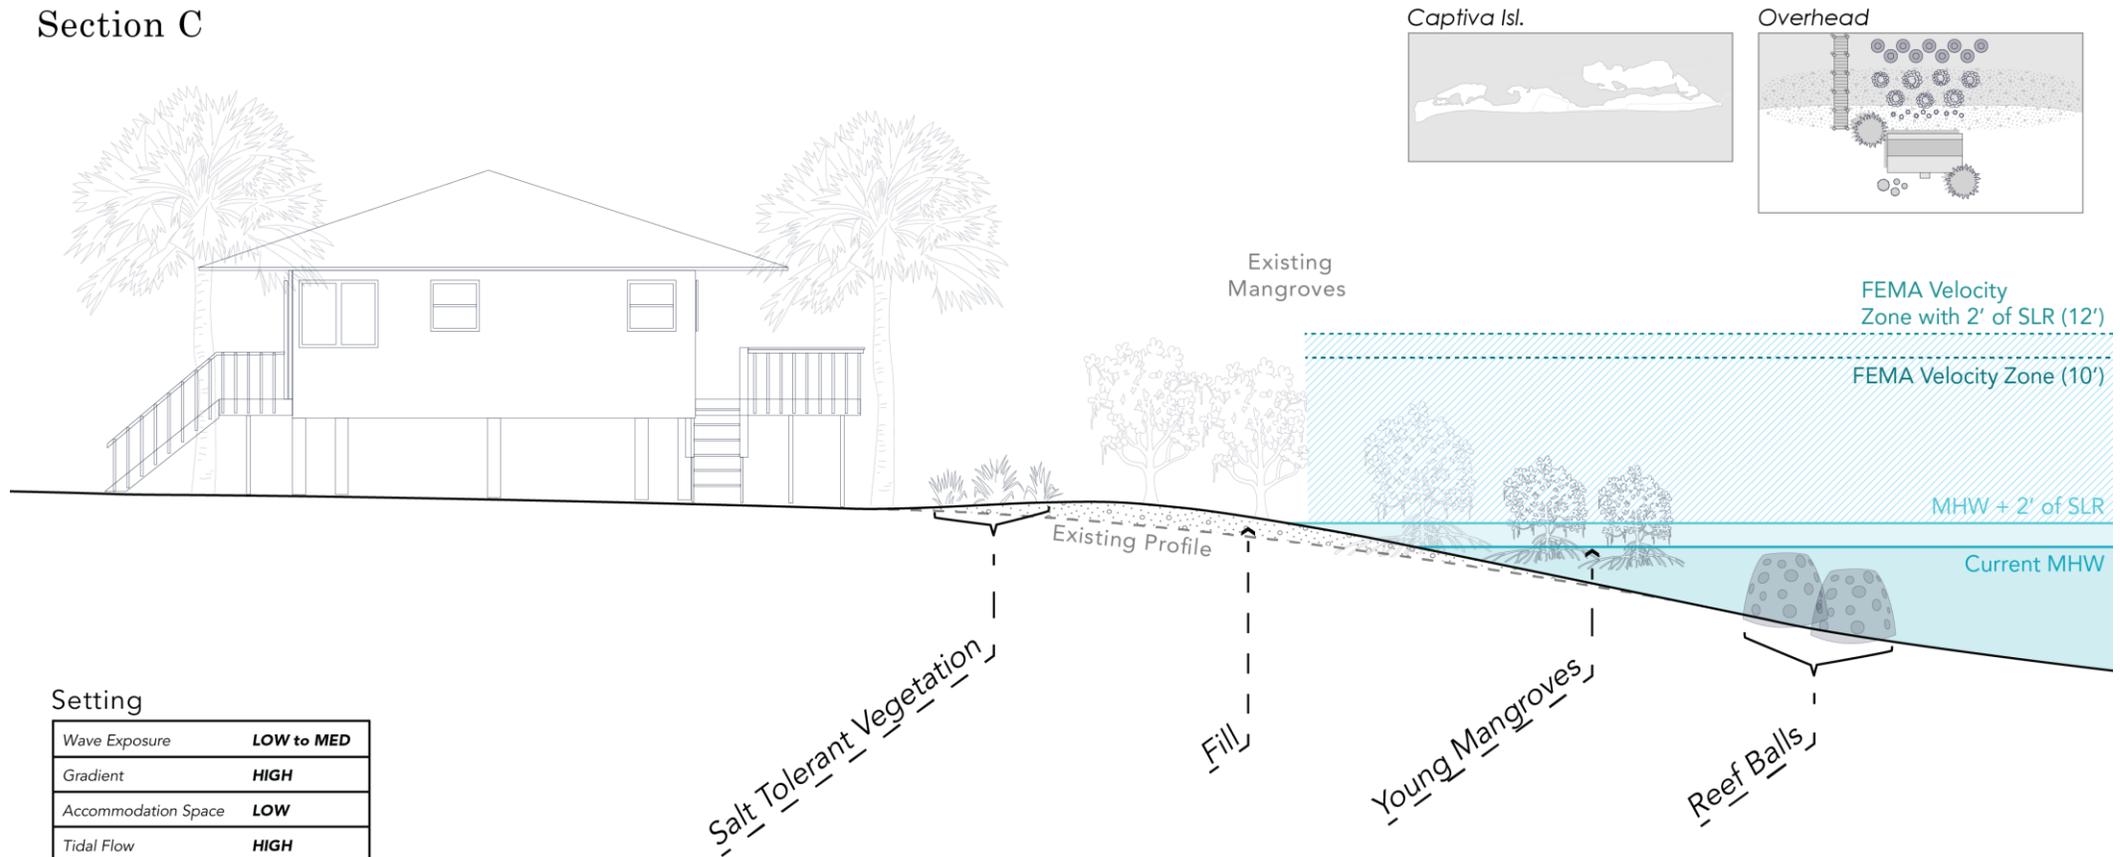

Overhead

- Fill (increase elevation)
- Mangrove seedlings
- Young mangroves
- Salt-tolerant vegetation
- Fill (increase elevation)

Conceptual Designs - Section C

Section C

Setting

Wave Exposure	LOW to MED
Gradient	HIGH
Accommodation Space	LOW
Tidal Flow	HIGH

Priority Area 5: Blind Pass

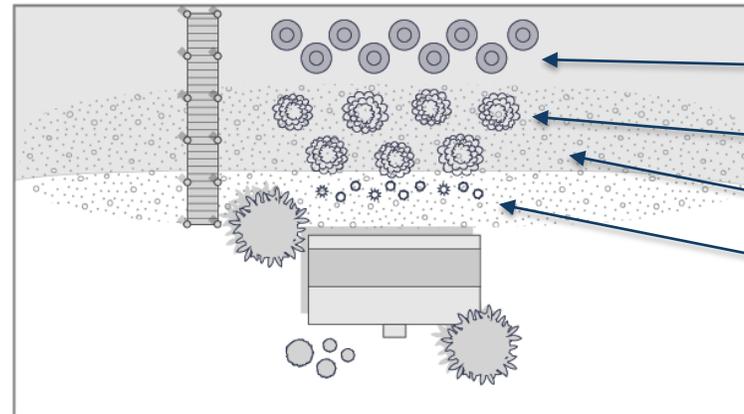

Conceptual Designs - Section C

Priority Area 5: Blind Pass

Setting

Wave Exposure	LOW to MED
Gradient	HIGH
Accommodation Space	LOW
Tidal Flow	HIGH

Overhead

Reef balls

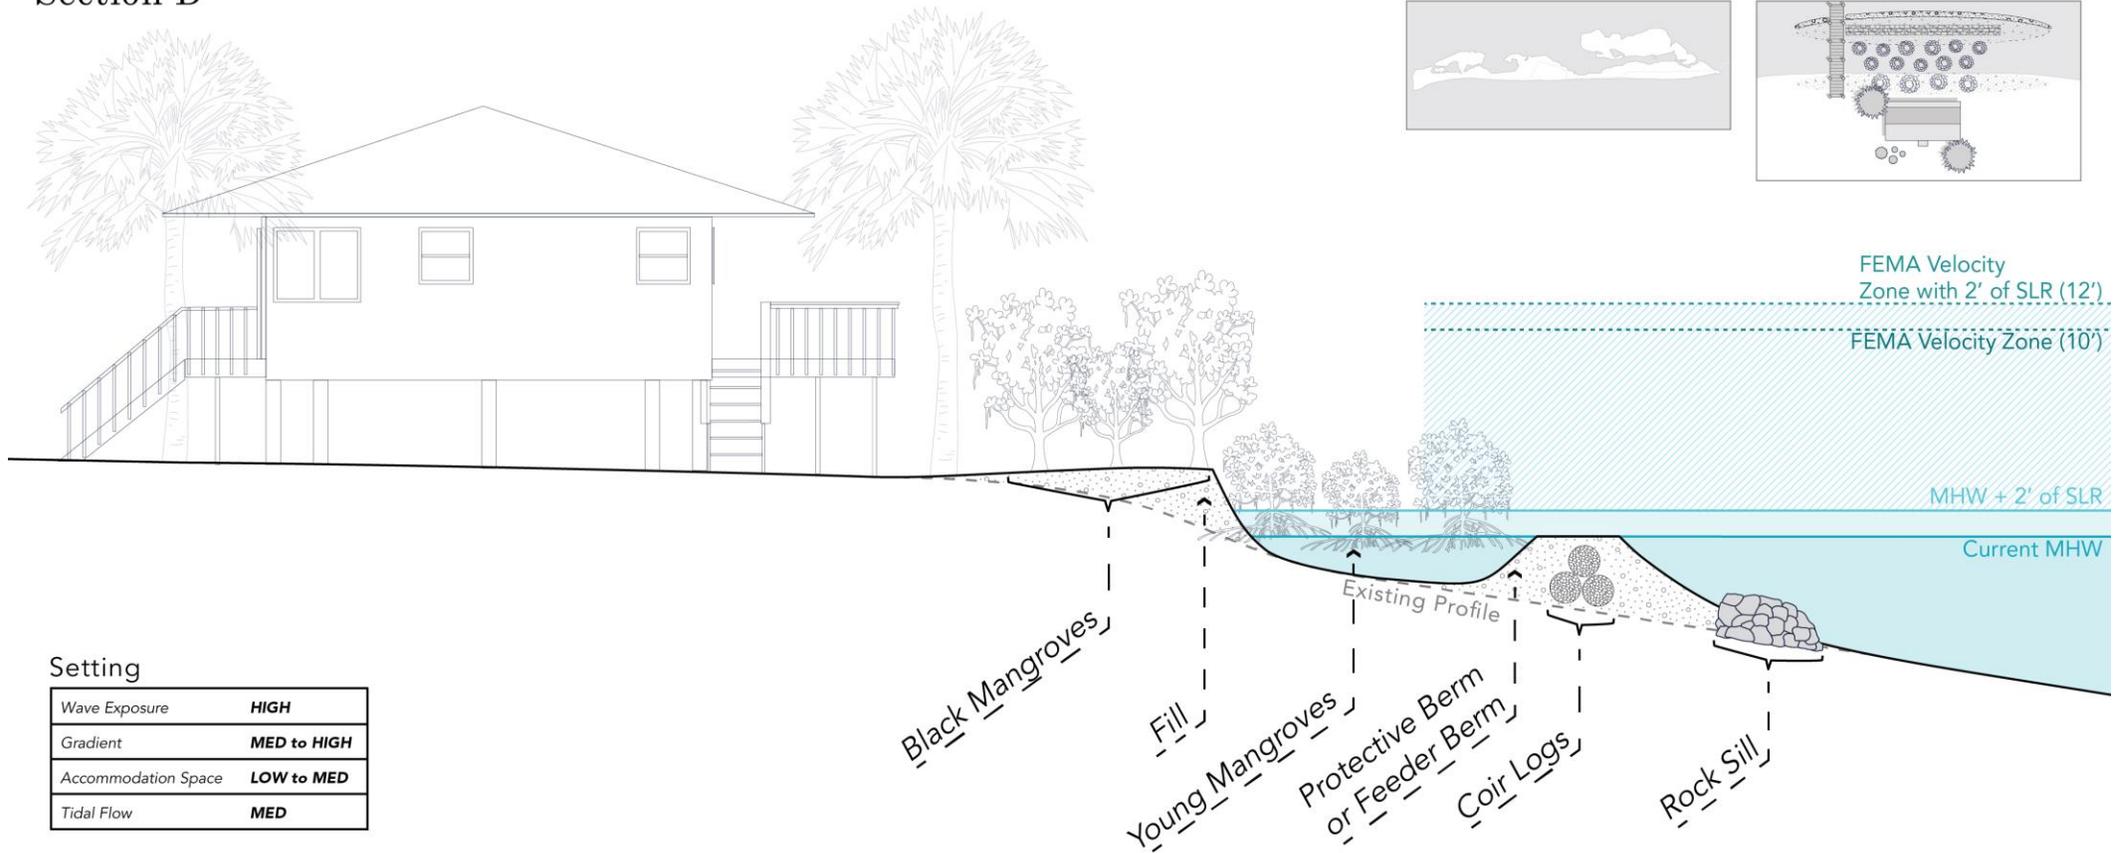

Young mangroves

Fill (increase elevation)

Salt-tolerant vegetation

Conceptual Designs - Section D

Section D

Setting

Wave Exposure	HIGH
Gradient	MED to HIGH
Accommodation Space	LOW to MED
Tidal Flow	MED

Priority Area 2 or 3: Village, no existing seawall

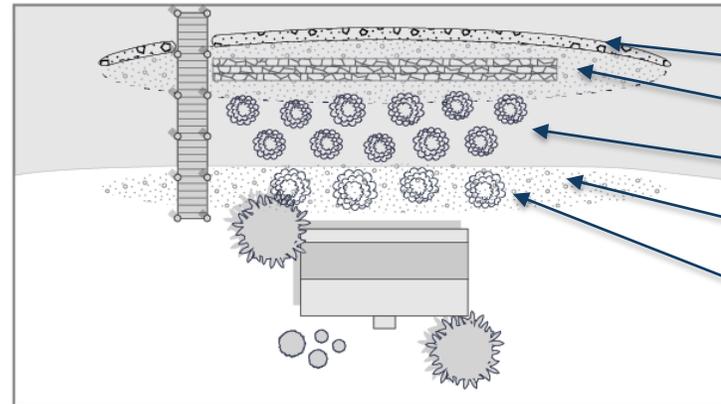

Conceptual Designs - Section D

Priority Area 2 or 3: Village, no existing seawall

Setting

Wave Exposure	HIGH
Gradient	MED to HIGH
Accommodation Space	LOW to MED
Tidal Flow	MED

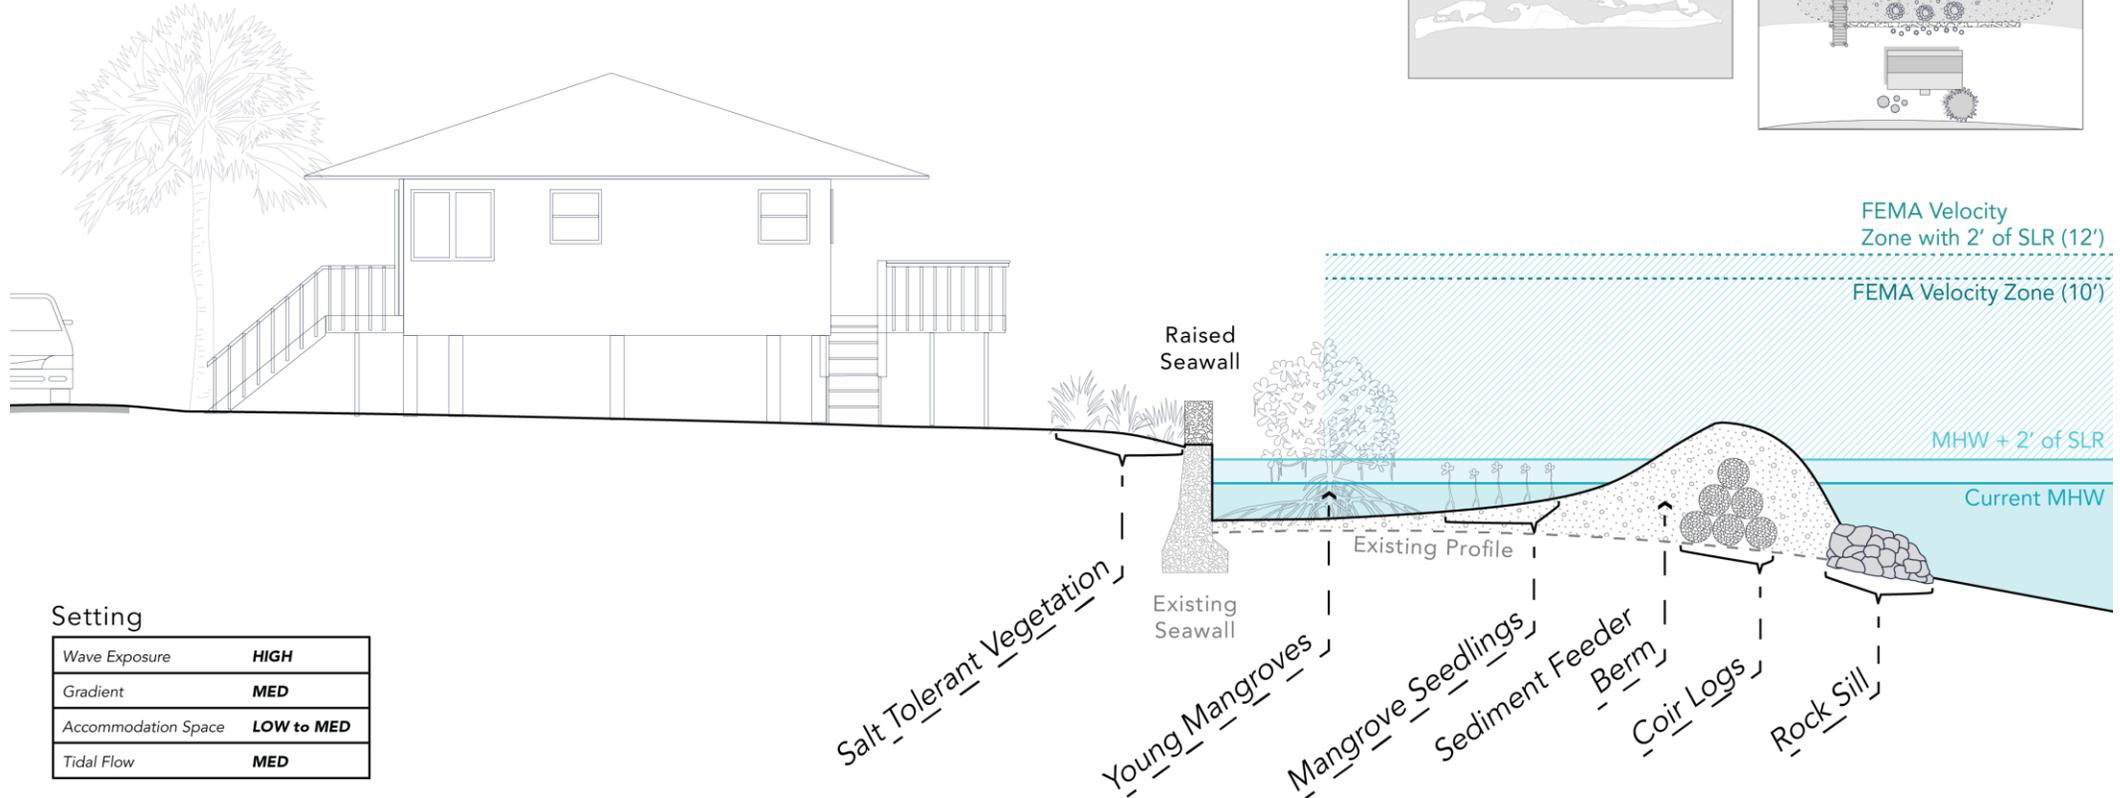

Overhead

- Rock sill
- Feeder berm with coir logs
- Young mangroves
- Fill (increase elevation)
- Mature upland mangroves

Conceptual Designs - Section E

Section E

Setting

Wave Exposure	HIGH
Gradient	MED
Accommodation Space	LOW to MED
Tidal Flow	MED

Priority Area 2 or 3: Village, seawall

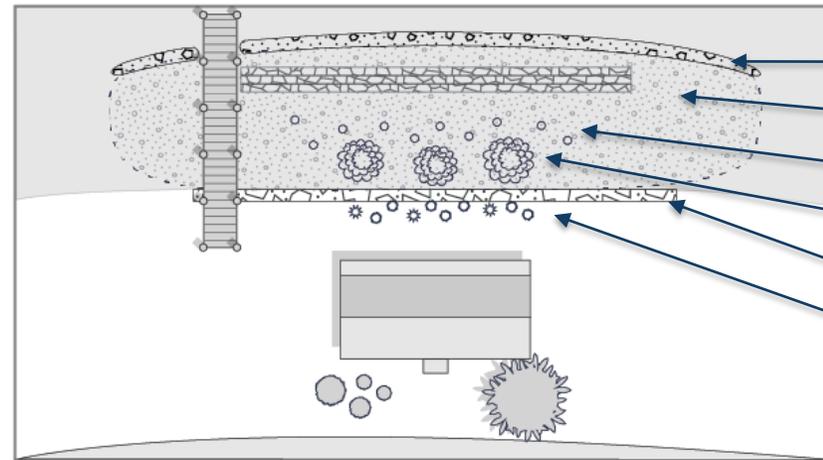

Conceptual Designs - Section E

Priority Area 2 or 3: Village, seawall

Setting

Wave Exposure	HIGH
Gradient	MED
Accommodation Space	LOW to MED
Tidal Flow	MED

Overhead

- Rock sill
- Feeder berm with coir logs
- Mangrove seedlings
- Young mangroves
- Seawall (opt. increase height)
- Salt tolerant vegetation

Summary

- › Conceptual designs to evaluate a variety of adaptation options
- › Intended to be interconnected – the elements work together for best success
- › Consideration of what would be permissible in an aquatic preserve
- › Intended to address SLR of 2 ft, but designs do incorporate some storm protection features
- › Maintenance will be required throughout history of project, similar to Gulf beach nourishment
